Debate on Development Strategy

1. Symptoms

- The Trello kanban shows lack of momentum, consistency, and a shared goal.
- The smart contracts shows lack of responsibility and organizational collaboration.
- More...

2. Typical technical guide

- Communicate that the management has a strong commitment, strategy, competence, and resources.
- Communicate the heartbeat of the management **every day** and more effectively.
- Organize and spur all major activities, no matter welcomed or not, consistently.
- Give them a tangible, encouraging strategy that give them everyday goal and self-guide.
- Both pull and push developers.

3. An attempt to follow the guide

A breakdown of the development project is suggested here in order to:

- Produce a shared topic that let them feel
  - the presence and commitment of the management
  - collaborative environment and the team
  - the individual's responsibility
- Let them realize the position of their tasks in a larger picture
- Let the management itself consistently control the Trello kanban
- Start a debate on the development strategy

Logical tasks and relations in CrossWise Re-launch Project (Software), in UML Activity Diagram. Some grammar rules are broken intentionally for simplicity.
Major tasks are highlighted. The diagram does not imply waterfall development model. Instead, we assume agile, incremental iteration and evolutionary development. Integrated automated testing will shorten the cycle of iteration. Extensive interaction and resources sharing between parallel tasks are required. Traditional Periphery and Core smart contract projects will be integrated to a single Dex project to reduce friction between developers. Contracts project will have a 3rd-person on-going Review and Test Scenario tasks to enhance vulnerability detection.
